

The Problem: Invisible Talent

“Talent Exists. Recruiter Attention Doesn’t.”

There are plenty of opportunities in the job market, but identifying the relevant talent for each task is an exhaustive and long process, leading to a disadvantage for a certain group of people

- Many tier 2 - tier 3 college/university students often have the relevant skills but lack the signalling advantage of a well-known institute name
- Internship applications are highly redundant and exhausting
- Recruiters receive hundreds of similar-looking applications for each role
- Most students apply with similar type of skillset and the recruiters look for the easy way out and choose the ones with a better college, branch
- Due to volume, recruiters filter on base factors (college, keywords) and miss skilled candidates
- The system is broken: talent exists, attention does not

No selective, mindful application, students end up applying everywhere due to the fear of missing out and the number of applicants for each position increases

- Many times this leads to people missing out on very relevant and good opportunities due to exhaustion and feeling of having done the maximum from their end, because of the sheer volume of this mundane task.
- When we send the recruiters resumes and applications from our websites and database, the companies can be rest assured that we are sending relevant applicants to them, this trust will take a certain time to build which will first require us to build a solid company reputation.
- Current situation in the market is that students either put their faith in their colleges or look for linkedin and other job market portal openings, there is no AI or system that eases or automates this procedure and produces tangible results, outcomes.
- So in reality, there is no solution to this very existing problem.

Pain points: Major tech & finance companies receive 300–1000+ applications per internship role.

Recruiters often shortlist <5% of applicants due to volume, not talent.

Many students with strong skills never get noticed because ATS and filters favour brand names or keywords.

Top companies receive hundreds — sometimes thousands — of internship/PPO applications per role, and only a tiny fraction ever get shortlisted.

Why the Internship Market Is Uniquely Broken in India – and Who Suffers Most:

“Structural bottlenecks in India’s hiring ecosystem amplify visibility gaps for skilled students”

Why India Is an Extreme Case

- India produces ~19 lakh engineering & management graduates annually, far exceeding structured internship capacity
- Internship hiring is centralized, short-window, and reputation-driven
- Recruiter bandwidth and evaluation capacity have not scaled with applicant volume
- Attention is bottlenecked through ATS portals, not distributed via networks

India vs Global Markets (Structural Difference)

India vs Global Internship Markets

Key Differences in Hiring Dynamics

Dimension	India	US / Europe
Applications per internship role	300–1,000+	50–200
Primary hiring channel	Job Portals & ATS	Referrals & Career Centers
Resume screening	Keyword & College Filters	Holistic, Profile-Based
Follow-up culture	Rare, Discouraged	Common, Expected
Institutional career support	Limited (Tier-2/3)	Strong Career Services
Role clarity	Often Vague	Clear & Defined
Recruiter bandwidth	Highly Constrained	More Distributed
Visibility for non-elite students	Very Low	Relatively Higher

Name: Final-Year Engineering Student

Age: 20–22

College: Tier-2 / Tier-3

Goal: Secure internship → PPO

Pain: Invisible to recruiters

Fear: Missing PPO window

- Students spend **50–70 hours/month** applying to internships
- Average success rate per application: **<0.3%**
- **<15%** of India’s students come from Tier-1 institutions
- **85%+** compete without strong alumni networks or recruiter access
- Tier-2/3 students apply to **2–3×** more roles for the same outcome
- Referral-based hiring increases interview chances by **5–10×** (largely inaccessible to this group)
- US/EU students apply to **5–20** internships per cycle
- Indian students apply to **80–250+** internships per cycle
- Recruiter-to-candidate ratio in India is **~10×** worse than US/EU markets

Primary Target User

- Pre-final and final year engineering and management students
- From Tier-2 and Tier-3 colleges, we are targeting colleges such as VIT, Amity, Manipal, newer NITs,
- Actively targeting internships and PPOs (time-bound urgency)

Why This Segment

- Possess relevant skills, projects, and certifications
- Lack institute brand signalling and referral access
- Face repeated rejection or ghosting despite competency
- Apply to 50–100+ roles per season
- Unsure where and how to apply effectively
- Feel invisible in the recruitment process

Willingness to Pay

- Already spending on resume services, prep courses, LinkedIn Premium
- ₹1,500/month is low relative to the risk of missing a PPO
- Fear of missing opportunities > cost of subscription

In mature markets, attention is distributed through networks. In India, attention is bottlenecked through platforms – disadvantaging skilled but unbranded students.

An AI-Led Internship Engine That Maximizes Recruiter Attention

“Automating outreach, follow-ups, and optimization — not resumes or job listings”

Over 75% of internship applications receive no recruiter response, primarily due to ATS filtering and lack of follow-up.

What the AI actually does...

- Identifies high-probability companies and roles where a student’s skills historically convert best, converts a student’s profile into a skill-role compatibility score
- Maps the right recruiters, teams, and outreach channels for each opportunity, i.e. Benchmarks profiles against historical recruiter response data
- Executes applications at scale across:
 - ATS portals
 - Recruiter emails
 - LinkedIn outreach

Continuous Optimization Loop

- Runs automated follow-ups at optimal intervals
- Tracks recruiter engagement signals:
 - Email opens & replies
 - LinkedIn views & responses
 - ATS status changes
- Learns weekly from outcomes to:
 - Refine targeting
 - Adjust outreach timing
 - Improve channel selection

Outcome for the Student

- Fewer but higher-quality applications
- Increased recruiter responses
- Reduced application burnout
- Higher probability of internship-to-PPO conversion

Manual vs AI-Led Internship Process

Why Manual Effort Fails vs How AI Maximizes Outcomes

Manual Applications	AI-Led System
Manual Applications	AI-Led System
Random role selection	Data-backed targeting
Generic resume usage	Context-aware positioning
ATS-heavy	Multi-channel outreach
No feedback loop	Continuous learning
High effort, low response	Optimized effort, higher response
From volume, low-irb;l app progress, not volume We hepik effort, higher product by heesers	

In a noisy market, visibility is the real advantage — and this system engineers it.

Reaching 1 Lakh Students Through Trust-Led Distribution

2025

“Community-led growth beats paid acquisition in student markets”

Primary Acquisition Channel: Campus Ambassadors

Model

One student ambassador per college

Incentives:

Free premium subscription

₹200 per paid referral

Why this works

Ambassadors already sit inside:

WhatsApp groups

Telegram channels

University mailing lists

Distribution happens inside trusted, closed networks

Target colleges

Large Tier-2 / Tier-3 campuses:

VIT, Manipal, Amity, newer / lower NITs, state engineering colleges

Low CAC, high credibility, scalable across campuses

Social Proof Engine

What we show

Screenshots of:

Recruiter replies

Interview emails

PPO announcements

Updated LinkedIn profiles

Why it converts

Students copy outcomes, not promises

Success stories spread organically across batches

Secondary Channel: Micro-Influencers (High ROI)

Who?

College-specific creators

5k–20k follower range

Why micro-influencers

Higher engagement than large creators

Followers are highly relevant (same college / same exams / same stress)

Content format

“How I got interview calls”

“How I avoided application burnout”

Proof-based storytelling, not ads

Why Students Keep Paying (Retention Logic)

Fear of missing:

PPO

Interview calls

Time-bound opportunities

₹1,500/month perceived as:

Lower than coaching fees

Lower than placement agent commission

Comparable to OTT subscriptions, but

with career upside

45,000, Campus Ambassadors

Primary growth lever

20,000, Peer Referrals

Trust-led spread

15,000, Micro-Influencers

High-ROI reach

10,000, Organic

Compounding baseline

≈ 1,00,000 students reached through trust-led distribution

Why This Is Cheap & Scalable

No heavy ad spend

Referral rewards paid only on conversion

CAC approaches zero at scale

Growth compounds as each batch

becomes seniors

Students don't pay us for applications — they pay us for peace of mind during the most stressful phase of their career.

Business Model, Scale and Economics

“High-margin SaaS with large market size and compounding data”

This growing feedback-driven dataset creates a defensible moat that cannot be replicated quickly.

Business Model

Monthly subscription priced at ₹1,500
Average user retention: 6 months
Lifetime value (LTV): ₹9,000 per user
Recurring, predictable revenue driven by subscription renewals

Revenue Potential

Targeting 1 lakh paying users
Total revenue potential: ₹90 crore
Monthly revenue: ₹15 crore
Annualised revenue run-rate: ₹180 crore

AI-Led Value Creation

The system continuously:
Parses resumes to identify skill signals
Matches profiles with relevant recruiters and teams
Executes outreach across ATS, email, and LinkedIn
Tracks recruiter engagement and interview outcomes
Optimizes targeting based on real response data

Market Size

TAM: ~4.3 crore students in India
SAM: ~60 lakh pre-final & final year students
Professional degrees (Engineering, Management, Pharma, etc.)
Actively seeking internships, PPOs, and entry-level roles

Compounding Data Advantage

Over time, the platform builds proprietary intelligence on:
Best resume formats by role and industry
Optimal outreach timing and follow-up cadence
Companies and teams most responsive to specific skill profiles

Economics (SaaS Advantage)

AI + automation-driven platform
Minimal incremental cost per additional user
No human-heavy operations
Gross margins exceeding 80% at scale

A high-margin SaaS business where outcomes improve as the platform scales.

Automating Visibility in Early-Career Hiring

“An AI-led platform that maximizes interview opportunities for students at scale”

Why this solution works?

Solves a structural market failure, not a surface-level problem
Focuses on attention and visibility, the real bottleneck in hiring
Targets a high-urgency segment with clear willingness to pay
Improves outcomes without increasing student effort

Why this is venture backable?

Large and growing market (millions of students every year)
Subscription-based recurring revenue
High-margin SaaS economics
Strong early path to scale via community-led distribution

Defensibility Over Time

Every application generates data:
Resume → recruiter → response → interview outcome
Platform continuously learns:
What converts
Where attention exists
Which profiles succeed where
Outcomes improve with scale, creating a self-reinforcing data moat

Product Expansion

Role-specific optimization for:
Product, Consulting, Finance, Tech
Industry-aware targeting (startups vs MNCs vs mid-size firms)

- Expand to:
- MBA programs
- International students applying to India-based roles
- Long-term: Adapt model to other high-volume markets (SE Asia, LATAM)

“Visibility is the real bottleneck in early-career hiring.”

Long-Term Vision

Expand from internships to:
Full-time placements
Entry-level hiring automation
Recruiter-side intelligence:
Skill demand trends
Faster, more accurate shortlisting
Become the default talent visibility layer for early-career hiring in India

From a student tool today to a hiring intelligence platform tomorrow.
